

Thank you for purchasing Wavy Hangers.

Using the template available at tmpro.com, design and print your transfer using dye sublimation inks. The template will print an outline that is 1/8" larger all the way around than the Wavy Hanger. Use this outline to center the smooth side of the Wavy Hanger down onto the transfer. We recommend using 2 small pieces of heat tape on opposite sides to hold the hanger to the transfer.

Press at 400 f face up with medium pressure. The pressing time will vary depending on your equipment and inks. I suggest 1 minute to start, you can go longer or shorter from there.

After pressing it is important to lay the hanger on a cool, smooth, flat surface to prevent warping while it cools. If the hanger does warp you can re heat slightly and then place a weight on top while cooling.

Simple slip the provided "S" hooks in the corners to connect hangers together. The hole on one side will always be a little to far in to slide the hook into, simply turn the hook 90 degrees to the side and hook it in (as if you were going to hook it on the side instead of top or bottom). Once hooked turn back to proper position then hook other side as normal.

When completed the assembly should look like the picture to the right. You can hook together as few or as many hangers as you like.
